DRYING TIME DURING DEFOGGING

**THE DRYING TIME OF THERMALLY INSULATED GLASS PANES
CAN VARY FROM 4 TO 8 WEEKS**

THIS TIME LIMIT MAY VARY ACCORDING TO:

- The location of the thermally insulated window,
- The climatic conditions that are favorable or not to the drying,
- The type of defogging.

PHASES OF DRYING

- Immediately after the technician performed a defogging process, the state of the window units will already be clearer, but not perfect.

The day after, your thermally insulated glass panels will have more condensation inside than before, and this mist will decrease over the days. This means that the evacuation of moisture (drying) is well initiated. This fog that resurfaces is quite normal and will gradually decrease in the coming weeks.

- The mist will be evacuated gradually until your window panes are completely free of humidity (condensation) and at this moment, the maximum clarity of your glass panels will be reached. This process will be done within the period of 4 to 8 weeks, as the case may be.

END OF THE 8 WEEK PERIOD

If your thermally insulated glass panels have not found their clarity / maximum transparency, within 8 weeks, please contact us and it is with pleasure that we will come and take a look at the situation and apply our guarantee if necessary.
